

## **Service License Agreement for Buck Turner**

**By: Reese Mothershed, Steven Thai, Amber Turner, Kartik Negi, Isaiah Johnson, Yaho Noudou Frank**

### **Statement of Business Problem**

Dr. No's Comic & Games Superstore has a web based Ordering system with several hyperlinks, catalogs, and additional store information all present within the same tab menu on the website. Our client, Buck Turner, discussed with us how customers have expressed their desire for an easier, cleaner system for executing this process. Mr. Turner also expressed his own personal interest in many of the additional information (store hours, point of contact, etc.) being more discretely presented on the page. The customers' also need a more intuitive ability to view and utilize previous orders/catalogs.

### **Description of Proposed Solution**

Mr. Turner has discussed his interest in the creation of an Android/iOS mobile app that remedies many of his listed issues with the current system. Our team's proposed solution includes creating an accompanying Android/iOS app that simplifies and clarifies the current website's functions. We plan to front-end the Ordering process with a user friendly and simple UI interface that makes the process of ordering and accessing catalogs understandable for all users. Additionally, the back-end of the system will be updatable as new inventory gets added into the store's current system, and will show these current inventories to customers. After orders have been placed, the customer will receive their order receipt for future use. This program will be geared with all additional utilities required to execute an intuitive system, including remembering user orders, updating inventory systems, and required analytics.

### **Milestones and Deliverables**

#### **Milestone 1:**

- Description of milestone: Requirements and Interactive Prototype

This milestone establishes a clear, shared understanding of what the app will do for Dr. No's customers and staff, and gives Mr. Turner something tangible to react to before any development begins. The team will translate our discussions with Mr. Turner into a defined set of features the app will support including how customers will view and reorder from past orders, how optional/detailed information will be presented without cluttering the screen, and how staff will keep inventory current. We will build an

interactive, clickable prototype (using a tool like Figma/Marvel) that stimulates the actual ordering flow, so Mr. Turner can click through the experience and confirm it matches what he's asking for before we begin building the real application.

- Description of deliverables (including presentation):
  - Defined list of app features and business requirements, written in plain terms
  - Interactive clickable prototype of the ordering flow and catalog browsing experience, ready for the client to test
  - Presentation walking Mr. Turner through the prototype and confirming it addresses his stated needs
- Time and Date: October 12, 2026

#### Milestone 2:

- Description of milestone: Core Ordering Experience

This milestone delivers a working version of the app that customers and staff can actually use to place and manage orders. Customers will also be able to browse the current catalog, search and filter items, add items to an order, and receive confirmation once an order is placed. Staff will be able to keep the catalog up to date and see what customers have ordered. This is the first version of the app that performs its core job – helping customers order comics and games without friction.
- Description of deliverables (including presentation):
  - Customers can browse the catalog of available comics/games
  - Customers can search for items by title or keyword
  - Customers can filter items by category
  - Customers can filter items by author/creator
  - Customers can filter items by price
  - Customers can filter items by availability
  - Customers can select quantity and place an order
  - Customers automatically receive an order receipt by email
  - Customers can view their past order history
  - Staff can add new items to inventory
  - Staff can edit existing item details

- Staff can remove items from inventory
  - Demo of the working ordering flow for Mr. Turner, with an opportunity for feedback
- Time and Date: November 16, 2026

### Milestone 3:

- Description of milestone: Security, Speed, and Full Feature Completion  
This milestone ensures the app is safe, reliable, and fast enough for daily use at the store, and completes any remaining features so the app is ready for final review. Staff accounts will be protected so only authorized employees can manage inventory and view customer orders, customers will be able to easily reorder from a previous month, and the app will be tested to make sure it performs quickly and reliably for everyday use.
- Description of deliverables (including presentation):
  - Customers can quickly re-order items from a previous order
  - Store-requested analytics available
  - App loads and responds in under 5 seconds during normal use
  - Known bugs identified during testing are resolved
  - Full walkthrough/demo of the completed app for Mr. Turner
- Time and Date: November 30, 2026

### **Final Deliverable**

- Final Android/iOS app, installable on phones, with all features from the requirements specifications
- Documentation: User guide, technical documentation, and source code.
- Training materials for Buck Turner and store staff (using the Android/iOS app and updating inventory).
- Transfer of assets: code repository, Android/iOS app files, and any accounts or credentials used to build the app.
- Final presentation and hand-off meeting
- Android/iOS App fully finished and polished by December 7th

## **Communication Standards**

Communication regarding milestones and deliverables will happen via Microsoft Teams with the consistent schedule of Thursdays at 5:00 pm, unless client accommodations are required. Questions regarding team specifications/questions will be conducted via Dr. No's Comics & Games Superstore official store email and team email [rmothers@students.kennesaw.edu](mailto:rmothers@students.kennesaw.edu). If primary team contact is unavailable, team communication will resume via backup accounts [sthai@students.kennesaw.edu](mailto:sthai@students.kennesaw.edu), [ijohns58@students.kennesaw.edu](mailto:ijohns58@students.kennesaw.edu), [knegi@students.kennesaw.edu](mailto:knegi@students.kennesaw.edu), [aturn214@students.kennesaw.edu](mailto:aturn214@students.kennesaw.edu), or [fyahonou@students.kennesaw.edu](mailto:fyahonou@students.kennesaw.edu) in that exact order of contact. All communication engagement between client Buck Turner and development team must include an emailed copy to Professor Nick Murphy at email [nmurphy1@kennesaw.edu](mailto:nmurphy1@kennesaw.edu). Any communication of any type between the team and the client (including Teams) must be told to Professor Murphy via email from team members.

## **How to Amend Contract**

- For clients: The client sends a written change request to the student point of contact, copying Professor Nick Murphy. Our team evaluates how it impacts the scope and schedule, and replies within 3 business days. The change occurs when authorized in writing by both parties.
- For students: The team submits a written change request with the reason to the client: Copying Professor Nick Murphy. The client responds to the team within 3 business days. For the change to be implemented, the client has to accept it in writing.

## **Appendix**

Requirements Specification:

### **1. Introduction**

#### **1.1. Purpose:**

This section specifies the system requirements for the ordering application proposed by our team. It details the functional and non-functional requirements regarding the Android/iOS app build, as well as its associated interface and system architecture required for visitor ease of use.

#### **1.2. Scope:**

Our team will be designing a fully functional Android/iOS mobile application that takes the functionality found in the current ordering system and simplifies it for customer utility. Customers will be able to view current selling catalogs, place online orders, view their previous orders, and view additional store information including store hours, email,

points of contact, and online deals. Store owner and staff will be able to fully alter and edit their inventory while simultaneously updating the Android/iOS app without direct access.

2. **System Overview**

2.1. **Functions:**

Customers will be able to view and order items from Dr No’s current inventory directly from their mobile device. They will have the ability to view catalog PDFs as updated and presented by Dr No’s staff. Customers will have the ability to view previous online orders that are saved to their email/device, and save purchase settings for future deliveries. Staff will be able to update their current inventory system and have it instantly reflect within the Android/iOS app directly to their customers. Staff will have a simplified system for changing and presenting catalogs, and can directly integrate this application into their current system workflow. The application will utilize sleek, modernized UI for ease of use, and modern organization customs to optimize information presentation.

3. **Functional Requirements**

3.1. **Desired Outcomes**

Dr. No’s mobile ordering Android/iOS app will include the following system requirements:

- Modernized UI for customer and staff access
- Optimized information slides for declutter and user clarity
- Fully functional mobile port of current system listing
- Accessible store catalogs (downloadable)
- Real time inventory update (linked to store system)
- Receipt and order system for customers
- Customer analytics for staff
- Editable catalog and inventory system for staff

3.2. **Input-Output Relationships**

| User Input                    | System Output                                                                   |
|-------------------------------|---------------------------------------------------------------------------------|
| User selects ordering catalog | Catalog is downloaded to the user's mobile device. Downloaded PDF can be viewed |
| User selects to view listings | Listings are shown via mobile port                                              |

|                                                           |                                                                                                                                                                                         |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User selects to purchase order                            | Purchase window is opened and functions identically to web variant (if needed)                                                                                                          |
| User selects to view previous order (if needed)           | Displays previous customer order receipt including issue number, price, amount, and date                                                                                                |
| User selects for additional store information             | The side panel opens with sublisting information.                                                                                                                                       |
| User selects sublisting for information                   | Desired information is prompted on screen including reformatted store hours. Information regarding mailing and order discounts are shown via ordering system for reference for customer |
| Staff clicks to update catalog                            | File prompt opens for staff to select desired PDF for catalog display. This catalog is updated to customer                                                                              |
| Staff clicks to login                                     | Login window is displayed with password guard                                                                                                                                           |
| Staff clicks to edit listings                             | Listing editing window open, and edits customer's listing view                                                                                                                          |
| Staff clicks for customer analytics                       | Analytic window opens showing desired customer analytics in mobile friendly format                                                                                                      |
| Staff clicks to view current and previous customer orders | Detailed listing of customer's names, orders, cards, issues, amounts, and any other required information is shown.                                                                      |

### 3.3. User Access and Functionalities

FR-1.1: System will allow users to create an account via their email and phone number, with optional ability to add address.

FR-1.2: System will have option to send order receipts to customer's email.

### 3.4. Catalog and Inventory

FR-2.1: Staff will have ability to view catalog items

FR-2.2: Staff will have ability to edit catalog items

FR-2.3: Staff will have ability to read catalog items

FR-2.4: Staff will have ability to update catalog items

FR-2.5: Staff will have ability to delete catalog items

FR-2.6: Staff will have ability to filter inventory items (by issue, author, price)

FR-2.7: System will allow staff to add to inventory

FR-2.8: System will allow staff to delete from inventory

FR-2.9: System will allow staff to edit inventory (rearrange inventory)

FR-2.10: System will allow staff to change catalog

FR-2.11: System will allow staff to sort by availability

### 3.5. **Ordering and Customer History**

FR-3.1: System will allow customers to view the price and description of items

FR-3.2: System will allow customers to select the quantity of items when adding to cart

FR-3.3: System will send order details to both staff dashboard, as well as customer email/phone number.

FR-3.4: System will hold copies of previous customer order

### 3.6. **Customer Analytics**

FR-4.1: System will show staff current pending customer orders

FR-4.2: System will show staff previous customer orders

FR-4.3: System will show staff customer names

## 4. **Non-Functional Requirements**

### 4.1. **Performance and Sync**

NFR-1.1: Application inventory will synchronize with staff inventory and catalog updates

NFR-1.2: Mobile Android/iOS app load times will not exceed more than 5 seconds under normal network conditions.

### 4.2. **Security**

NFR-2.1: The system will not record or keep any customer information not essential for operation

NFR-2.2: The system will only record customer information with explicit customer approval

NFR-2.3: The system will password protect all client access features, and keep them away from customer domains.

#### 4.3. **Scalability**

NFR-3.1: The system will account for future inventory changes (including names, descriptions, prices, authors, and other important client required categories).

NFR-3.2: The system will contain all required services for editing and altering information

NFR-3.3: The system will allow staff to add catalogs

NFR-3.4: The system will allow staff to remove catalogs

NFR-3.5: The system will allow staff to edit catalogs (change catalog image)

NFR-3.6: The system will be built with the capacity for future alterations or additions regarding system functionality (both functional and non-functional).

NFR-3.6: The system will include a UI that has the capacity to accommodate future system integration.

#### 4.4. **Usability**

NFR-4.1: The system will utilize light, simplistic UI to encourage ease of access for all users

NFR-4.2: The system will be self contained and convenient. Everything users need to function on the client side will be easily adaptable for everyone

NFR-4.3: All required information regarding staff functionalities will be provided within the launch window of the system (including technical reports, documents, and user manuals).

#### Weekly Development Schedule (Tentative)

| Date:                    | Front-End                                                                                                                                                                                                   | Back-End                                                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| September 21-28          | <p>Drives, docs, and other necessary tools are created for sharing and storing progress.</p> <p>Wireframing tools, and future dev tools are decided.</p> <p>Front-End devs determine work distribution.</p> | <p>Setup code repository and project structure</p> <p>Compare backend tools options</p> <p>Start drafting the data model</p> |
| September 28 - October 5 | Wireframes are being developed. Related                                                                                                                                                                     | Design the database schema(Customer, inventory,                                                                              |

|                         |                                                                                                                                                                     |                                                                                                                                  |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
|                         | documentation (if needed) are worked on.                                                                                                                            | catalogs, orders, receipts, staff)                                                                                               |
| October 5-12            | Final prototypes are being finished for client approval.<br><br>Final documents are being finished for UX design                                                    | Create the base backend code: database, staff authentication<br><br>Finish the architecture and data model documentation         |
| October 12-19           | Client adjustments are made to wireframes for active development.<br><br>Needed tools are installed and file/source code placements are confirmed and put together. | Improve the schema based on client adjustment<br><br>Start implementing inventory management                                     |
| October 19-26           | UI functionalities are beginning to be programmed, and designs are being implemented.                                                                               | Finish inventory management (add, edit, delete, sort, availability)                                                              |
| October 26 - November 2 | Continued programming and design implementation                                                                                                                     | Implement order placement (cart quantities, stock validation). Build receipt generation. Forward order detail to staff dashboard |
| November 2-9            | Finishing up programming and beginning debugging, testing, and addressing any errors. The backend system starts integration into the front-end.                     | Implement order history<br><br>Forward order detail to staff dashboard<br><br>Start Testing                                      |
| November 9-16           | Design changes are made via client feedback. Front and Back end integration continue. Debugging and testing continues.                                              | Continue frontend and backend integration, and testing                                                                           |
| November 16-23          | Last minute integrations are finishing up. Additional content is patched in (if                                                                                     | Improve application security and permission                                                                                      |

|                          |                                                                                                                                                                                              |                                                                            |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
|                          | needed).                                                                                                                                                                                     |                                                                            |
| November 23-30           | Last minute design changes, optimization, testing is continued. User manuals and additional doc information is beginning to be written.                                                      | Optimize performance (5 second load target), fix bugs from QA              |
| November 30 - December 7 | All final docs are written, testing is completed, and the program is complete. Presentation material is organized and formatted. Source code, application, and user manuals are handed over. | Complete final Testing. Submit the code repository, and final presentation |

(Green is Milestone 1, Orange is Milestone 2, and Blue is Milestone 3)
